(54) Title: SAFETY DEVICE FOR A LADDER

(57) Abstract: A bracket arrangement (11) for removable attachment to the upper regions of a ladder (12) is disclosed. The bracket has a pair of laterally spaced apart arms (18) for adjustably rotatable attachment to respective sides (16) of the ladder. The arms extend generally away from the ladder towards a roof (14) of a building when the ladder is used against the side (15) of said building to gain access to the roof. The angle between the arms and the plane of the ladder is adjustable to suit varying conditions of use. The bracket has a pair of braces (23), each attached to respective sides of the ladder and adjustably rotatable about the point at which each is attached and extending from the ladder on respective sides thereof for locking each respective arm of the bracket so as to maintain each arm in predetermined angular relationship with respect to the plane of the ladder. The bracket has a cross member (19) extending at least between the free ends or free end regions of each arm for placement against the roof of the building.
